Primovascular system

Now I want to know if any of you have heard about the new system that has been discovered in the body, which they're calling the Primovascular system. The primovascular system was first discovered in the 60s by a doctor in 1962 to 1965, but it kind of was set aside because the doctor working on it passed on, and so his research was set aside and it's just being recently picked up again.

There's more study going on with it and what they've realized is it's a system that exists in and around the blood vessels and lymphatic tissues. It's covered with stem cells, protein, collagen, DNA, and hyaluronic acid. So when we look at that, it sounds an awful lot like Qi.

This is very interesting and exciting for anyone who's in East Asian medicine because the system really maps the qi system, the acupoint system, and describes it into the realm of Western medicine.

The system wasn't observed with the tools that they currently use to investigate the human body. It can now be looked at through different instruments and scopes.It is being mapped out more extensively. So it'll be interesting in the next decade or so to see what medical science comes up with.

And you heard it first here! Maybe some of you have heard it before, but it's new and upcoming, and it really does help us frame up the East Asian medicine system a little bit more.
